

Services

Electrical site condition assessment and failure investigation

Service description:

Asset owners are presented with several long-term challenges when maintaining a safe, reliable and fully functioning system. A condition assessment can assist with a number of these challenges:

Prioritising your maintenance programme

Identifying obsolete electrical and control equipment

Ensuring health and safety requirements are met

Ensuring the electrical equipment and installation complies with New Zealand legislation

A request for a condition assessment typically follows a failure or having identified an electrical hazard.

The team at Neo has undertaken condition assessments at numerous water and wastewater utilities, timber mills and industrial facilities. The majority of these have taken place at critical plants with limited opportunity for prolonged shutdowns. Our team are formally trained professional engineers with experience in industrial facilities and a number have an electrical trade background. With this combination of specialist expertise and practical experience, we can provide comprehensive, pragmatic and cost-effective assessments you can trust.
